“

During March of 2013 I purchased a Steppir BigIR IV antennas along with the 80M Loading Coil Kit. At that time, I lived in a beachfront gated community with HOA regulations. For antennas, I was allowed to have an HF antenna as long as it was a vertical. I originally bought another brand of HF vertical, but it performed poorly. I was subsequently advised to look into buying a Steppir antenna. After constructing the antenna and using elevated radials, I was astonished at how well the antenna performed on all bands including the WARC bands. About three years ago, we moved from the beach to Northwest Georgia. I took the antenna down and re-installed it at my new Georgia location. As you can see from the photograph, I was forced to use elevated radials again, due to the layout of the land.

After installation at the new location, the antenna performed perfectly and continues to impress me with its superior performance.

As an avid ham radio operator and a career RF Engineer, I would encourage anyone that wants a great antenna to consider Steppir Products.
