“

I have been an Amateur Radio Operator since 1971 but was never serious about HF until about 5 years ago. I had an 80-10 vertical that performed so-so. I met another ham on the air who was also running a YouTube channel. He had an amazing signal out of Florida and found out he was running the SteppIR Urban Beam. I had limited space, so I looked into it for my location and decided to purchase it. I enjoyed assembling the UrbanBeam, and was able to get it up in the air in about a week. It is installed on my tower at about 40ft. I was immediately blown away by the results. I am constantly getting 5-9 + signal reports all over the world. I almost always get through pile-ups in the first few calls.

I know it is a bit expensive compared to other antennas, but considering that it takes the place of multiple antennas, it is well worth it.
